Price to Earnings Ratio: The price-to-earnings ratio is used to assess a company's valuation. To compute this ratio, the latest closing price is divided by the company's last fiscal year's Earnings Per Share. The ratio represents a weighted harmonic mean of the price-to-earnings ratios of its holdings with negative values being excluded from the calculation. **Price to Book Ratio:** represents the ratio of the current closing price of the share to the latest quarter's book value per share. **Average Market Cap:** The average size of the securities the fund invests in. **Alpha:** A measure of performance on a risk-adjusted basis. Alpha takes the volatility (price risk) of a mutual fund and compares its risk-adjusted performance to a benchmark index. The excess return of the fund relative to the return of the benchmark index is a fund's alpha. **Beta:** Beta measures the fund's sensitivity to market movements beta greater than 1 is more volatile than the market beta less than 1 is less volatile than the market. **R-Squared:** R-Squared reflects the percentage of a fund's movements that are explained by movements in its benchmark, showing the degree of correlation between the fund and benchmark. This figure is helpful in assessing how likely it is that beta is statistically significant. **Standard Deviation:** Standard Deviation measures the volatility of the fund's returns. Higher deviation represents higher volatility. **Sharpe Ratio:** Sharpe Ratio uses a fund's standard deviation and its excess return (difference between the fund's return and the risk-free return of 90-day Treasury Bills) to determine reward per unit of risk.
