INVESTMENT PROCESS

- The Co-CIOs and their team of equity analysts employ Gotham's proprietary analytical framework to evaluate stocks within the coverage universe on measures of absolute and relative value.
- Gotham's equity research and risk controls are used to select long and short stock portfolios from a large market capitalization universe.
- The long (short) portfolio is rebalanced daily to weight most heavily those large cap stocks priced at the largest discount (premium) to Gotham's assessment of value.
- In general, as a company appears cheaper, its weight in the portfolios increase.
- Risk for the funds are managed by limiting concentration in any one company, industry or sector. In addition, gross and net exposures are managed daily to remain within carefully defined ranges.

IMPORTANT INFORMATION

Mutual fund investing involves risks, including possible loss of principal. Short sales by a fund theoretically involve unlimited loss potential since the market price of securities sold short may continuously increase. The fund will use leverage to make additional investments which could result in greater losses than if the fund were not leveraged. The fund utilizes swap agreements in its investment program. The use of derivatives such as swaps exposes the fund to additional risks including increased volatility, lack of liquidity and possible losses greater than the fund's initial investment. It is anticipated the fund will frequently adjust the size of its long and short positions and thus may experience high portfolio turnover which may increase brokerage costs.
